

# Suggestion to improve the SUUNTO RACE

**One new widget devoted to time**

**that we could pin**

**Or ...**

**Accessible when you scroll up**

# The issue

The fact that you do not regroup into a single “place” all what concerns the time aspect creates 2 issues

- First of all you are obliged to navigate into multiple place to know these informations , also some are not easily available
- This oblige you to place such information on the main screen and as consequence you cannot display anymore in the first screen a “screen” made for adventurous people 😊

**The first purpose of any watch is to show us time in all its aspects**

Put yourselves in our shoes ...

What is the main first purpose of absolutely any watch ?

**→ To manage and show us the time**

So to tell you what time it is, which day we are, when it will ring and if there is enough energy to arrive to this moment

What is our main pleasure to wear a beautiful sport watch instead just a clock ? **→ To show beautiful « adventure » screens**

What we like it to see other informations or graphs which tell stories on adventure and make us feel we are all Mike Horn even if we are sit on a chair in our office 😊 so for some it will be the altitude, the weather, their health information, the sunset or sunrise .....

# The proposal

In fact we need 2 WATCH FACES ....

A first one which is the one giving us the satisfaction to wear a sport watch and especially a SUUNTO one

(so the one you already provide)

but also a second one very easy to access and for a much more classical use of a watch ... and this traditional use can come on second position

For example :

Look !!! My watch is wonderful .... It shows me the many things of the earth like the altitude I'm, the sunset sunrise, etc etc etc

I want now to know more about the date, second time, the next alarm clock, the percentage of battery to be sure it will ring

Then, just in a single action I can get this on a second screen

**It is just a matter of a new widget devoted to time and that I can access easily**

Observing your watch I saw that when I move up using the crown, I was arriving to a stable screen BUT a screen not really ... more a combination of the % of battery remaining plus the beginning of the several sport mode ...

So you could take advantage of this stability and propose a real complete screen that displays time information

An alternative could have this new screen as a widget and so eventually if this is easier to develop than to let me pin it when I click on the crown

# Let see this new widget

This widget is on all time aspect so regrouping in a single place

The day we are  
so if someone ask  
I can tell him/her

The current time  
Finally it's a watch isn't it 😊

The next alarm clock  
so I immediatelly check if I set it correctly

The second time  
I work with India so it's very  
important for me

The percentage of battery  
So I'm sure I have enough for my  
journey and especially to have  
the watch ring when time will  
arrive to the next alarm clock ...  
so I will wake up !!!!

# Let see this new widget

Now let me propose a more ambitious widget which will allow to see the time and all alarm clocks of the day  
Taking advantage of graphical objects you already have developped

Use this circle and triangles to show the current time and all the alarms (ALL !!!)

Tricks with colors :

Light gray = alarm deactivated  
Blue = alarm active to come  
Yellow = alarm to ring < 1h  
Orange = alarm to ring < 30 min  
Orange = alarm to ring < 10 min

With this trick on color, you can see absolutely all the alarms havign been executed or deactivated is finally the same so easy to do

This alarm will ring in less than 10 minute now

For the progress bar that represent the % of battery, the color could be meaningfull also

**RED** means you cannot go to week-end without charge++

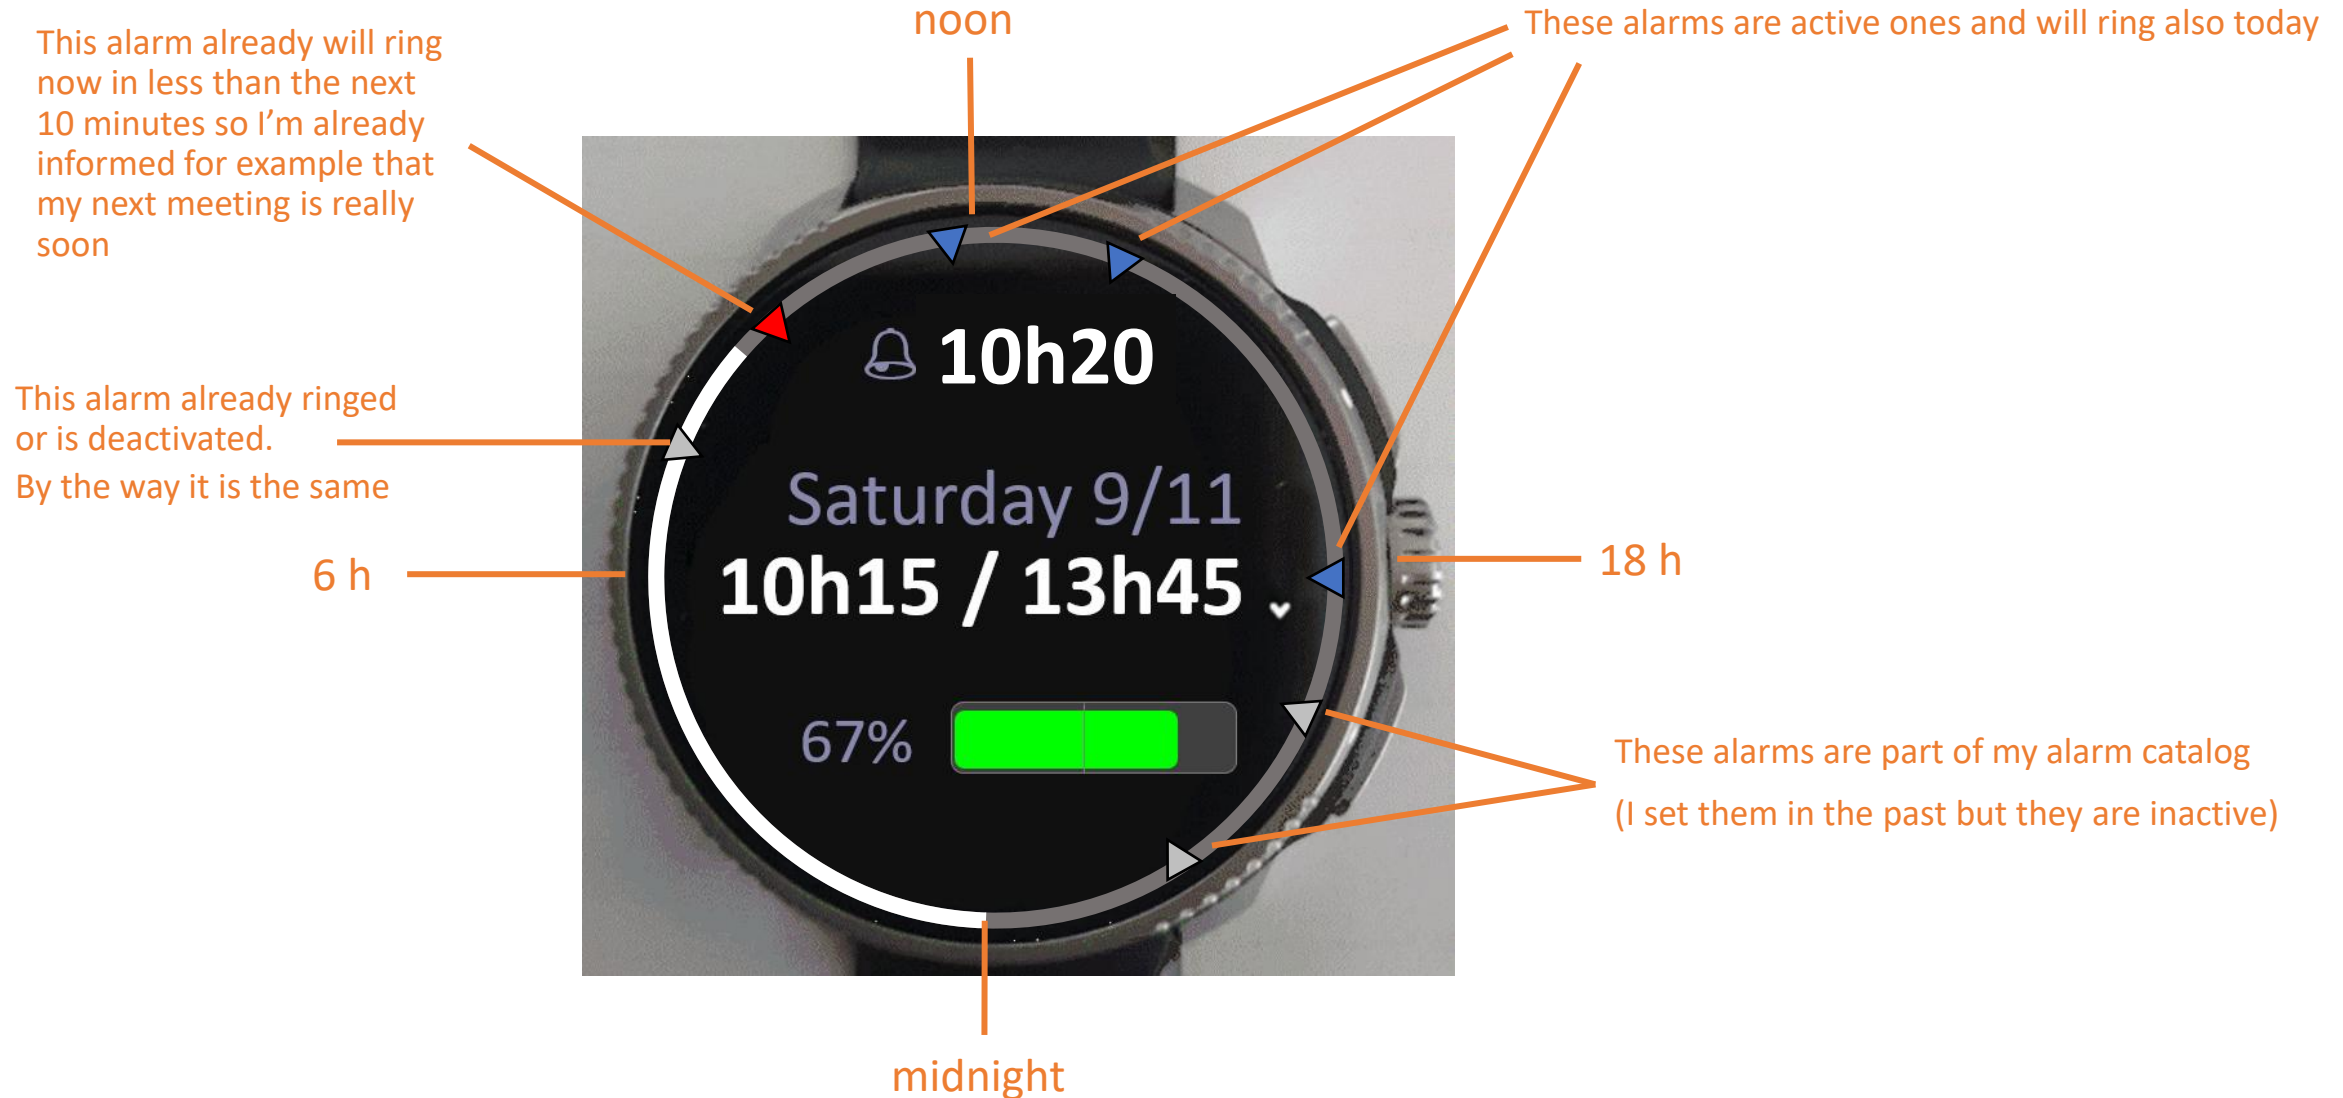

**YELLOW** means you cannot have a full week without charge++

**GREEN** is above one week without charge++

Charge++ means : normal use of the watch, 5 times to look to time every day, Maximum 2 sport mode used during 1

# Now I can see all the alarm clocks of the day

Another more version « graphical » version could also show this wonderful sun race

# Here the result ....

A new widget called DATE & TIME and that allow me to see concentrated all the time and date aspect of the day with also the time race. I voluntary set neutral white and gray colors for the time race and not mixing with your already very beautiful sun race

# In case you go for the stable position, it could give this

This is the upper screen that we will access by moving up the crown

Here it is a classical universal watch screen so I need to see

- The percentage of energy
- The next clock that will wake me up
- The second day time
- The day and date

Oh oh ... strange ... I do not see the time ..... strange for a classical universal watch

Why ??? because in any case a watch is a watch and the time is on main screen already

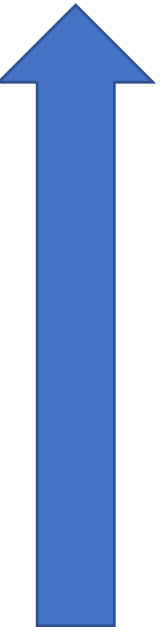

---

Now that all the secondary but essential classical time elements are set on the secondary watch I can have all the pleasure to get a screen which value a lot what SUUNTO offer

For sure I will see what time it is

But I can now use all the rest of the space to see for example

- The evolution of pressure ... what a pleasure to see a beautiful graph
- The current altitude
- The compass
- Whatever is a beautiful screen but with information that emphasis SUUNTO but finally that are less essential ... more cosmetic

# In case you create a widget, it could pin it

Now that all the secondary but essential classical time elements are set on the secondary watch I can have all the pleasure to get a screen which value a lot what SUUNTO offer

For sure I will see what time it is

But I can now use all the rest of the space to see for example

- The evolution of pressure ... what a pleasure to see a beautiful graph
- The current altitude
- The compass
- Whatever is a beautiful screen but with information that emphasis SUUNTO but finally that are less essential ... more cosmetic

This is the pinned screen that we will access by clicking on the crown

Here it is a classical universal watch screen so I need to see

- The percentage of energy
- The next clock that will wake me up
- The seconday time
- The day and date

Oh oh ... strange ... I do not see the time ..... strange for a classical universal watch

Why ??? because in any case a watch is a watch and the time is on main screen already
